(54) Title: 3-HETEROCYCLYLPROPANOHYDROXAMIC ACID AS PROCOLLAGEN C-PROTEINASE INHIBITORS

(57) Abstract: Compounds of compounds of formula (I) and their salts, solvates and prodrugs, wherein the substituents are as defined herein, are Procollagen C-proteinase inhibitors for the treatment of scars.

3-HETEROCYCLYLPROPANOHYDROXAMIC ACID AS PROCOLLAGEN C-PROTEINASE INHIBITORS

This invention relates to a certain class of compounds, and the pharmaceutically acceptable salts, solvates and prodrugs thereof, which inhibit Procollagen C-proteinase ("PCP"). They are therefore useful in the treatment of mammals having conditions alleviable by inhibition of PCP. Especially of interest is an antiscarring treatment for wounds.

Fibrotic tissues, including dermal scars, are characterised by excessive accumulation of extracellular matrix, mainly collagen type I. It is thought that inhibition of collagen deposition will reduce formation of scar tissue. Collagen is secreted as the precursor, procollagen, which is transformed into the insoluble collagen by cleavage of the C-terminal propeptide by PCP. PCP is a zinc-dependent metalloprotease which is secreted from TGF- β -activated fibroblasts belonging to the subfamily of astacin-like proteases and able to cleave the C-terminal peptide of types I, II and III procollagens. Furthermore, data suggest that PCP activates lysyl oxidase, an enzyme essential for the formation of covalent cross-links which stabilise the fibrous form of collagen. Therefore, inhibition of PCP may not only reduce collagen deposition but may also make collagen more accessible for degradation.

Collagen is integral to, among other things, the proper formation of connective tissue. Thus, the over- or under-production of collagen or the production of abnormal collagen (including incorrectly processed collagen) has been linked with numerous connective tissue diseases and disorders. Mounting evidence suggests that PCP is an essential key enzyme for the proper maturation of collagen (see for example International Patent Application publication number WO 97/05865).

The present invention relates to substances capable of inhibiting PCP activity in order to regulate, modulate and/or reduce collagen formation and deposition. More specifically, the invention relates to the use of compounds and pharmaceutical compositions thereof for the treatment of various conditions relating to production of collagen.

At present more than nineteen types of collagens have been identified. These collagens, including fibrillar collagen types I, II, III are synthesized as procollagen precursor molecules which contain amino- and carboxy-terminal peptide extensions. These peptide extensions, referred to as "pro-regions," are designated as N- and C- propeptides, respectively. The pro-regions are typically cleaved upon secretion of the procollagen triple helical precursor molecule from the cell to yield a mature triple helical collagen molecule. Upon cleavage, the "mature" collagen molecule is capable of association, for example, into highly structured

collagen fibers. See e.g., Fessler and Fessler, 1978, *Annu. Rev. Biochem.* 47:129-162; Bornstein and Traub, 1979, in: *The Proteins* (eds. Neurath, H. and Hill, R.H.), Academic Press, New York, pp. 412-632; Kivirikko et al., 1984, in: *Extracellular Matrix Biochemistry* (eds. Piez, K.A. and Reddi, A.H.), Elsevier Science Publishing Co., Inc., New York, pp. 83-118; Prockop and Kivirikko, 1984, *N. Engl. J. Med.* 311:376-383; Kuhn, 1987, in: *Structure and Function of Collagen Types* (eds. Mayne, R. and Burgeson, R.E.), Academic Press, Inc., Orlando, Florida, pp. 1-42.

An array of conditions has been associated with the inappropriate or unregulated production of collagen, including pathological fibrosis or scarring, including endocardial sclerosis, idiopathic interstitial fibrosis, interstitial pulmonary fibrosis, perimuscular fibrosis, Symmers' fibrosis, pericentral fibrosis, hepatitis, dermatofibroma, cirrhosis such as biliary cirrhosis and alcoholic cirrhosis, acute pulmonary fibrosis, idiopathic pulmonary fibrosis, acute respiratory distress syndrome, kidney fibrosis/glomerulonephritis, kidney fibrosis/diabetic nephropathy, scleroderma/systemic, scleroderma/local, keloids, hypertrophic scars, severe joint adhesions/arthritis, myelofibrosis, corneal scarring, cystic fibrosis, muscular dystrophy (duchenne's), cardiac fibrosis, muscular fibrosis/retinal separation, esophageal stricture and Pyloric's disease. Further fibrotic disorders may be induced or initiated by surgery, including scar revision/plastic surgeries, glaucoma, cataract fibrosis, corneal scarring, joint adhesions, graft vs. host disease, tendon surgery, nerve entrapment, Dupuytren's contracture, OB/GYN adhesions/fibrosis, pelvic adhesions, peridural fibrosis, restenosis. Other conditions where collagen plays a key role include burns. Fibrosis of lung tissue is also observed in patients suffering from chronic obstructive airways disease (COAD) and asthma. One strategy for the treatment of these diseases and conditions is to inhibit the overproduction and/or deposition and/or unregulation of collagen. Thus, identification and isolation of molecules which control, inhibit and/or modulate the production and deposition of collagen are of major medical interest.

Recent evidence suggests that PCP is the essential key enzyme that catalyzes the cleavage of the Procollagen C-propeptide. This has been demonstrated in fibrillar collagens, including type I, type II, and type III collagen.

PCP was first observed in the culture media of human and mouse fibroblasts (Goldberg et al., 1975, *Cell* 4:45-50; Kessler and Goldberg, 1978, *Anal. Biochem.* 86:463-469), and chick tendon fibroblasts (Duskin et al., 1978, *Arch. Biochem. Biophys.* 185:326-332; Leung et al., 1979, *J. Biol. Chem.* 254:224-232). An acidic proteinase which removes the C-terminal propeptides from type I procollagen has also been identified (Davidson et al., 1979, *Eur. J. Biochem.* 100:551).

A partially purified protein having PCP activity was obtained from chick calvaria in 1982. Njieha et al., 1982, *Biochemistry* 23:757-764. In 1985, chicken PCP was isolated, purified and characterized from conditioned media of chick embryo tendons. Hojima et al., 1985, *J. Biol. Chem.* 260:15996-16003. Murine PCP has been subsequently purified from media of cultured mouse fibroblasts. Kessler et al., 1986, *Collagen Relat. Res.* 6:249-266; Kessler and Adar, 1989, *Eur. J. Biochem.* 186:115-121. Finally, the cDNA encoding human PCP has been identified, as set forth in the above-referenced articles and references disclosed therein.

Experiments conducted with these purified forms of chick and mouse PCP have indicated that the enzyme is instrumental in the formation of functional collagen fibers. Fertala et al., 1994, *J. Biol. Chem.* 269:11584.

As a consequence of the enzyme's apparent importance to collagen production, scientists have identified a number of PCP inhibitors. See e.g., Hojima et al., *supra*. For example, several metal chelators have demonstrated activity as PCP inhibitors. Likewise, chymostatin and pepstatin A were found to be relatively strong inhibitors of PCP. Additionally, α_2 -Macroglobuline, ovostatin, and fetal bovine serum appear to at least partially inhibit PCP activity.

Dithiothreitol, SDS, concanavalin A, Zn^{2+} , Cu^{2+} , and Cd^{2+} are similarly reported to be inhibitory at low concentrations. Likewise, some reducing agents, several amino acids, phosphate, and ammonium sulfate were inhibitory at concentrations of 1-10mM. Further, the enzyme was shown to be inhibited by the basic amino acids lysine and arginine (Leung et al., *supra*; Ryhänen et al., 1982, *Arch. Biochem. Biophys.* 215:230-235). Finally, high concentrations of NaCl or Tris-HCl buffer were found to inhibit PCP's activity. For example, it is reported that, with 0.2, 0.3, and 0.5M NaCl, the activity of PCP was reduced 66, 38, and 25%, respectively, of that observed with the standard assay concentration of 0.15M. Tris-HCl buffer in a concentration of 0.2-0.5M markedly inhibited activity (Hojima et al., *supra*). PCP activity and its inhibition have been determined using a wide array of assays. See e.g., Kessler and Goldberg, 1978, *Anal. Biochem.* 86:463; Njieha et al., 1982, *Biochemistry* 21:757-764. As articulated in numerous publications, the enzyme is difficult to isolate by conventional biochemical means and the identity of the cDNA sequence encoding such enzyme was not known until reported in the above referenced and related patent applications.

In view of its essential role in the formation and maturation of collagen PCP appears to be an ideal target for the treatment of disorders associated with the inappropriate or unregulated production and maturation of collagen.

The identification of effective compounds which specifically inhibit the activity of PCP to regulate and modulate abnormal or inappropriate collagen production is therefore desirable and the object of this invention.

- 5 Matrix metalloproteases (MMPs) constitute a family of structurally similar zinc-containing metalloproteases, which are involved in the remodelling, repair and degradation of extracellular matrix proteins, both as part of normal physiological processes and in pathological conditions.

- 10 Another important function of certain MMPs is to activate other enzymes, including other MMPs, by cleaving the pro-domain from their protease domain. Thus, certain MMPs act to regulate the activities of other MMPs, so that over-production in one MMP may lead to excessive proteolysis of extracellular matrix by another, e.g. MMP-14 activates pro-MMP-2

- 15 During the healing of normal and chronic wounds, MMP-1 is expressed by migrating keratinocytes at the wound edges (U.K. Saarialho-Kere, S.O. Kovacs, A.P. Pentland, J. Clin. Invest. 1993, 92, 2858-66). There is evidence which suggests MMP-1 is required for keratinocyte migration on a collagen type I matrix in vitro, and is completely inhibited by the presence of the non-selective MMP inhibitor SC44463 ((N4-hydroxy)-N1-[(1S)-2-(4-methoxyphenyl)methyl-1-((1R)-methylamino)carbonyl)]-(2R)-2-(2-methylpropyl)butanediamide) (B.K. Pilcher, J.A. Dumin, B.D. Sudbeck, S.M. Krane, H.G. Welgus, W.C. Parks, J. Cell Biol., 20 1997, 137, 1-13). Keratinocyte migration in vivo is essential for effective wound healing to occur.

- MMP-2 and MMP-9 appear to play important roles in wound healing during the extended remodelling phase and the onset of re-epithelialisation, respectively (M.S. Agren, Brit. J. 25 Dermatology, 1994, 131, 634-40; T. Salo, M. Mäkanen, M. Kymäniemi, Lab. Invest., 1994, 70, 176-82). The potent, non-selective MMP inhibitor BB94 ((2S,3R)-5-methyl-3-[(1S)-1-(methylcarbamoyl)-2-phenylethyl]carbamoyl)-2-[(2-thienylthio)methyl]hexanohydroxamic acid, batimastat), inhibits endothelial cell invasion of basement membrane, thereby inhibiting angiogenesis (G. Tarboletti, A. Garofalo, D. Belotti, T. Drudis, P. Borsotti, E. Scanziani, P.D. 30 Brown, R. Giavazzi, J. Natl. Cancer Inst., 1995, 87, 293-8). There is evidence that this process requires active MMP-2 and/or 9.

- Thus PCP inhibitors which significantly inhibit MMPs 1 and/or 2 and/or 9 would be expected to impair wound healing. MMP-14 is responsible for the activation of MMP-2, and thus inhibition of 35 MMP-14 might also result in impaired wound healing.

For recent reviews of MMPs, see Zask et al, *Current Pharmaceutical Design*, 1996, 2, 624-661; Beckett, *Exp. Opin. Ther. Patents*, 1996, 6, 1305-1315; and Beckett et al, *Drug Discovery Today*, vol 1(no.1), 1996, 16-26.

- 5 Alternative names for various MMPs and substrates acted on by these are shown in the table below (Zask et al, *supra*).

Enzyme	Other names	Preferred substrates
MMP-1	Collagenase-1, interstitial collagenase	Collagens I, II, III, VII, X, gelatins
MMP-2	Gelatinase A, 72kDa gelatinase	Gelatins, collagens IV, V, VII, X, elastin, fibronectin; activates pro-MMP-13
MMP-3	Stromelysin-1	Proteoglycans, laminin, fibronectin, gelatins.
MMP-7	Pump, Matrilysin	Proteoglycans, laminin, fibronectin, gelatins, collagen IV, elastin, activates pro-MMP-1 and -2 .
MMP-8	Collagenase-2, neutrophil collagenase	Collagens I, II, III
MMP-9	Gelatinase B, 92 kDa gelatinase	Gelatins, collagens IV, V, elastin
MMP-12	Macrophage metalloelastase	Elastin, collagen IV, fibronectin, activates pro-MMP-2 & 3.
MMP-13	Collagenase-3	Collagens I, II, III, gelatins
MMP-14	MT-MMP-1	Activates pro-MMP-2 & 13, gelatins
MMP-15	MT-MMP-2	unknown
MMP-16	MT-MMP-3	Activates pro-MMP-2
MMP-17	MT-MMP-4	unknown

- 15 According to one aspect of the present invention, there are provided compounds of formula (I):

(I)

wherein:

X is C₁₋₆ alkylene or C₂₋₆ alkenylene, each of which is optionally substituted by one or more fluorine atoms;

R is aryl, C₅₋₈ cycloalkenyl or C₃₋₈ cycloalkyl optionally substituted by one or more fluorine atoms;

[HET] is a divalent heterocyclic moiety selected from

Z is H or C₁₋₄ alkyl,

Y is a mono- or bicyclic unsaturated ring system containing from 5 to 10 ring atoms, of which up to 4 which are hetero-atoms independently selected from N, O and S, and which ring system is optionally substituted by one or more substituents independently selected from =O, C₁₋₄ alkyl, C₁₋₄ alkoxy, NR¹R², SO₂NR¹R², CO₂R¹, CONR¹R², CH₂CO₂R¹, NR¹CO₂R², NR¹SO₂R² or het¹,

R¹ and R² are each independently selected from H and C₁₋₄ alkyl optionally substituted by C₁₋₄ alkoxy,

het¹ is a N-linked 4- to 6-membered mono- or bicyclic heterocycle optionally containing 1 or 2 further hetero ring atoms independently selected from N and O, which heterocycle is optionally substituted by one or more substituents independently selected from =O, C₁₋₄ alkyl, C₁₋₄ alkoxy, NR¹R², SO₂NR¹R², CO₂R¹, CONR¹R², CH₂CO₂R¹, NR¹CO₂R², NR¹SO₂R² or het²,

het² is a N-linked 4- to 6-membered mono- or bicyclic heterocycle optionally containing 1 or 2 further hetero ring atoms independently selected from N and O,

"aryl" is phenyl optionally substituted by one or more substituents independently selected from

R³, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups,

and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.

"Alkyl", "alkylene", "alkoxy", "alkanoyl", and "alkenylene" groups, including in groups

5 incorporating said moieties, may be straight chain or branched where the number of carbon atoms allows.

Halogen is taken to mean fluorine, chlorine, bromine or iodine.

10 Pharmaceutically-acceptable salts are well known to those skilled in the art, and for example include those mentioned in the art cited above, and by Berge et al, in J.Pharm.Sci., 66, 1-19 (1977). Suitable acid addition salts are formed from acids which form non-toxic salts and include the hydrochloride, hydrobromide, hydroiodide, nitrate, sulphate, bisulphate, phosphate, hydrogenphosphate, acetate, trifluoroacetate, gluconate, lactate, salicylate, citrate, tartrate, 15 ascorbate, succinate, maleate, fumarate, gluconate, formate, benzoate, methanesulphonate, ethanesulphonate, benzenesulphonate, pamoate, camsylate, and p-toluenesulphonate salts.

Pharmaceutically acceptable base addition salts are well known to those skilled in the art, and for example include those mentioned in the art cited above, and can be formed from bases 20 which form non-toxic salts and include the aluminium, calcium, lithium, magnesium, potassium, sodium and zinc salts, and salts of non-toxic amines such as diethanolamine.

Certain of the compounds of formula (I) may exist in one or more zwitterionic forms. Certain of the compounds of formula (I) may exist in one or more tautomeric forms. Certain of the 25 compounds of formula (I), their salts, solvates, prodrugs, etc. may exist in one or more polymorphic forms. It is to be understood that the compounds of formula (I) include all such zwitterions, tautomers and polymorphs..

The compounds of formula (I), their salts, hydrates, prodrugs etc. can exhibit isotopic variation, 30 e.g. forms with enriched ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , etc. may be prepared, for example by suitable variation of the synthetic methods described herein using methods and reagents known in the art or routine modification thereof. All such isotopic variants are included in the scope of the invention.

35 Prodrug moieties are well-known to those skilled in the art (see for example the article by H Feres, in Drugs of Today, vol 19, no.9 (1983) pp.499-538, especially section A1), and for example include those specifically mentioned in A.A. Sinkula's article in Annual Reports in

Medicinal Chemistry, vol 10, chapter 31, pp.306-326, herein incorporated by reference, and the references therein. Specific prodrug moieties which may be specifically mentioned are aliphatic-aromatic, carbonate, phosphate and carboxylic esters, carbamates, peptides, glycoside, acetals and ketals, tetrahydropyranyl and silyl ethers. Such prodrug moieties can be cleaved in situ, e.g. are hydrolysable in physiological conditions, to give compounds of formula (I).

Certain of the compounds of the formula (I) may exist as geometric isomers. The compounds of the formula (I) may possess one or more asymmetric centres, apart from the specified centres in formula (I), and so exist in two or more stereoisomeric forms. The present invention includes all the individual stereoisomers and geometric isomers of the compounds of formula (I) and mixtures thereof.

Preferably the compounds of formula (I) have the following stereochemistry (IA):

(IA)

Preferably X is a linear C_{2-6} alkylene moiety optionally substituted by one or more fluorine atoms. More preferably X is propylene.

Preferably [HET] is

Preferably R is C_{3-8} cycloalkyl optionally substituted by one or more fluorine atoms.

More preferably R is cyclobutyl, cyclopentyl or cyclohexyl optionally substituted by one or more fluorine atoms.

Most preferably R is cyclohexyl.

Preferably Y is a 5- or 6-membered unsaturated ring containing 0, 1 or 2 ring hetero-atoms independently selected from N and O,

and which ring is optionally substituted by one or more substituents independently selected from =O, C₁₋₄ alkyl, C₁₋₄ alkoxy, NR¹R², SO₂NR¹R², CO₂R¹, CONR¹R², CH₂CO₂R¹, NR¹CO₂R², NR¹SO₂R² and het¹.

- 5 More preferably Y is a 5- or 6-membered unsaturated ring containing 0, 1 or 2 ring hetero-atoms independently selected from N and O,
and which ring is optionally substituted by one or more substituents independently selected from =O, CONH₂, CONHCH₃, CON(CH₃)₂, CH₃, NH₂, CO₂C₂H₅, CO₂H, CH₂CO₂CH₃, NHCH₃, NHC₂H₅, N(CH₃)₂, morpholino, imidazol-1-yl, methoxy, ethoxy and NHSO₂CH₃.
- 10 Yet more preferably Y is 5-carbamoylpyridin-3-yl, uracil-5-yl, pyridin-4-yl, 6-methylpyridin-3-yl, 5-carboxypyridin-3-yl, 6-methoxycarbonylmethylpyridin-3-yl, 6-(4-methylpiperazino)pyridin-3-yl, 6-(3-dimethylaminoazetidino)pyridin-3-yl, 6-(3-morpholinoazetidino)pyridin-3-yl, 4-carboxypyridin-2-yl, 6-dimethylaminopyridin-3-yl, 6-(imidazol-1-yl)pyrazin-2-yl, 3-morpholinopyrazin-2-yl, 3-pyrrolidinopyrazin-2-yl, 3-dimethylaminopyrazin-2-yl, 3-methylaminopyrazin-2-yl, 3-
- 15 methylsulphonamidophenyl, 3-carboxyphenyl or 6-ethoxypyrazin-2-yl.

Most preferably Y is uracil-5-yl or 4-carboxypyridin-2-yl.

- A preferred group of compound of formula (I) are those wherein each substituent is as specified
- 20 in the Examples below.

Another preferred group are the compounds of the Examples below and the salts, solvates and prodrugs thereof. Especially preferred are the compounds of Examples 1 and 25 and the salts, solvates and prodrugs thereof.

- 25 A further aspect of the invention is a PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14.
- A further aspect of the invention is the use of a PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14 in medicine.
- 30 Further related to this aspect of the invention is the use of a PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14 in the manufacture of an antiscarring medicament.
- Further related to this aspect of the invention is a method of treating a condition mediated by PCP and in which MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14 have a beneficial effect,
- 35 with an effective amount of PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14, an example of such a condition being a wound.

Preferably the PCP inhibitor of formula (I) mentioned in this aspect of the invention is selective against at least MMP-1, MMP-2 and MMP-9.

Most preferably the said PCP inhibitor of formula (I) is selective against MMP-1, MMP-2, MMP-9, and MMP-14.

- 5 Preferably the said selective PCP inhibitor of formula (I) has an IC_{50} vs. PCP of 0.5 μ M or lower, and selectivities vs. MMP-2 and MMP-9 of at least 30-fold, in the tests described herein.

Preferably the selective PCP inhibitor of formula (I) has an IC_{50} vs. PCP of 0.1 μ M or lower, and selectivities vs. MMP-1, MMP-2, MMP-9 and MMP-14 of at least 300-fold, in the tests described herein.

10

Another aspect of the invention is a substance of formula (I) described herein, including the salts, solvates and prodrugs thereof, for use in medicine.

Another aspect of the invention is a substance of formula (I) described herein, including the

- 15 salts, solvates and prodrugs thereof, for use in treating a PCP-mediated condition, such as in an antiscarring medicament.

Another aspect of the invention is the use of the substances of formula (I) described herein, including the salts, solvates and prodrugs thereof, in the manufacture of a medicament for

- 20 treatment of a PCP-mediated condition (e.g. an antiscarring medicament).

Another aspect of the invention is a pharmaceutical composition comprising a compound of formula (I), salts thereof, solvates thereof and/or prodrugs thereof, and a pharmaceutically acceptable diluent, carrier or adjuvant.

25

Another aspect of the invention is the combination of a compound of formula (I), or a salt, solvate or prodrug thereof, with another material useful in treating wounds, such as:

- (i) a growth factor such as TGF- β -3 (Renovo), IGF-1 (Genentech), IGF-1 complex (Celtrix), KGF-2 or FGF-10 (Sumitomo), DWP-401/EGF (Daewoong) or SNK-863 (Sanwa Kagaku
30 Kenkyusho);
(ii) a growth factor agonist such as Noggin (Regeneron);
(iii) a growth factor antibody/antisense material, such as those to: TGF- β -1 or 2 (Renovo, CaT), PDGF (Il Yang) or CTGF (Fibrogen);
(iv) a hormone such as DHEAS (Pharmadigm), ConXn / Relaxin (Connetics);
35 (v) an antibody to adhesion compounds such as ICAM-1 (Boehringer);
(vi) a MMP beneficial to healing of wounds, such as Collagenase ABC (BioSpecifics);
(vii) a barrier such as ADCON (Gliatech);

(viii) skin products such as artificial skin systems such as those based on DermaGraft (Advanced Tissue Sciences Inc.), INTEGRA Artificial Skin (Integra Life Sciences Holding Corp.), cell cultures such as Apligraf / Graftskin (Novartis), those developed by Cell Genesys Inc., AlloDerm (LifeCell) or matrix formulation products such as Argidene gel (Telios Pharmaceuticals Inc.);

(ix) a uPA inhibitor such as those disclosed in WO 99/01451;

(x) a MMP-3 inhibitor such as those disclosed in WO99/35124, WO 99/29667 and WO 00/74681;

Yet another aspect of the invention is a method of treatment of a condition mediated by PCP comprising administration of a therapeutically-effective amount of a substance according to the above definitions.

It is to be appreciated that reference to treatment includes prophylaxis as well as the alleviation of established symptoms of PCP-mediated conditions and diseases.

The invention further provides Methods for the production of compounds of the invention, which are described below and in the Examples and Preparations. The skilled man will appreciate that the compounds of the invention could be made by methods other than those specifically described herein, by adaptation of the methods herein described in the sections below and/or adaptation thereof, for example by methods known in the art. Suitable guides to synthesis, functional group transformations, use of protecting groups, etc. are, for example, "Comprehensive Organic Transformations" by RC Larock, VCH Publishers Inc. (1999), and PJ Kocienski, in "Protecting Groups", Georg Thieme Verlag (1994), and any updated versions of said standard works.

In the Methods below, unless otherwise specified, the substituents are as defined above with reference to the compounds of formula (I) above.

The compounds of formula (I) may be made from the corresponding acids of formula (II) or the corresponding protected N-hydroxy acid species (III), where "P" is a suitable NHO-protecting group such as those mentioned in Greene and Wuts, *supra*. Of particular interest are compounds of formula (III) where "P" is a tri(C₁₋₄ alkyl)silyl group such as trimethylsilyl (TMS).

Deprotection of compounds of formula (III) to give compounds of formula (I) can be carried out using a suitable deprotection regime. For example, when P is TMS, an acidic hydrolysis can be used, such as reaction with methanolic hydrochloric acid or aqueous citric acid.

Transformation of acids (II) into compounds of formula (I) can be carried out using a number of methods, such as reaction with carbonyldiimidazole and a suitable base such as triethylamine, in a suitable solvent such as tetrahydrofuran (THF), followed by reaction with hydroxylamine (NH₂OH, suitably generated from a salt thereof, such as the hydrochloride, in the presence of a suitable base such as a tertiary amine, for example triethylamine).

Alternatively, acids (II) can be transformed into activated acid derivatives (IV), where L is a suitable leaving group such as OCO(C₁₋₄ alkyl) or imidazolyl, which can then be reacted with a protected hydroxylamine species "PONH₂", to give compounds of formula (III), above. Suitable examples of this transformation include reaction of the acid (II) with a suitable chloro-ester such as isobutyl chloroformate, with a suitable base, e.g. a tertiary amine such as triethylamine or N-methylmorpholine to give an activated acid (IV), where L is OCO(isobutyl). Suitable examples of preparation of compounds of formula (IV) where L is imidazolyl include reaction of acid (II) with carbonyldiimidazole in a suitable solvent such as methylene chloride, or with carbonyldiimidazole with a suitable tertiary amine base such as triethylamine in a suitable ether solvent such as THF.

The compounds of formula (IV) can be transformed into compounds of formula (III) by reaction with compounds of formula PONH₂, where P is as described earlier.

Compounds of formula (I) may also be made directly from compounds of formula (IV) by reaction with hydroxylamine, suitably generated in situ from a salt thereof (e.g. hydrochloride salt) and a suitable base such as a tertiary amine (e.g. triethylamine).

5 Compounds of formula (III) can be transformed into compounds of formula (I) as described earlier.

Compounds of formula (II) can be made by deprotection of the compounds of formula (V) where P¹ is a suitable carboxylic acid protecting group such as t-butyl, with a suitable deprotecting regime. For example when P¹ is t-butyl, the deprotection can be carried by reaction with trifluoroacetic acid.

10

Certain compounds of formula (I) may be transformed into other compounds of formula (I) by suitable functional group interconversion (FGI) of a type well-known to those skilled in the art. For examples where the compound of formula (I) contains an ester or acid moiety, these can be interconverted readily by known hydrolysis or esterification methods respectively. Hydrolysis of an ethyl ester is exemplified in Example 11 below which mentions the use of lithium hydroxide as base. Another example of an interconversion of compounds of formula (I) is where one compound of formula (I) contains what could be regarded as a protecting group and the interconversion can be regarded as a deprotection - e.g. Example 33 below describes the conversion of a t-butoxycarbonylamino compound (of Example 32) into the corresponding free amine using trifluoroacetic acid (TFA). Many other FGIs of compounds of formula (I) into other compounds of formula (I) are possible using methods exemplified in the Examples and Preparations sections below, and standard FGI chemistry known in the art.

10 It will be apparent to those skilled in the art that other protection and subsequent deprotection regimes during synthesis of a compound of the invention may be achieved by conventional techniques, for example as described in the volumes by Greene and Wuts, and Kocienski, *supra*, some of which are mentioned specifically herein.

15 Where desired or necessary the compound of formula (I) is converted into a pharmaceutically acceptable salt thereof. A pharmaceutically acceptable salt of a compound of formula (I) may be conveniently be prepared by mixing together solutions of a compound of formula (I) and the desired acid or base, as appropriate. The salt may be precipitated from solution and collected by filtration, or may be collected by other means such as by evaporation of the solvent.

20

Compounds of the invention are available by either the methods described herein in the methods, schemes, Examples and Preparations or suitable adaptation thereof using methods known in the art. It is to be understood that the synthetic transformation methods mentioned herein may be carried out in various different sequences in order that the desired compounds
5 can be efficiently assembled. The skilled chemist will exercise his judgement and skill as to the most efficient sequence of reactions for synthesis of a given target compound.

The compounds, salts, solvates (including hydrates) and prodrugs of the invention may be separated and purified by conventional methods.

10 Separation of diastereomers may be achieved by conventional techniques, e.g. by fractional crystallisation, chromatography or H.P.L.C. of a stereoisomeric mixture of a compound of formula (I) or a suitable salt or derivative thereof. An individual enantiomer of a compound of formula (I) may also be prepared from a corresponding optically pure intermediate or by
15 resolution, such as by H.P.L.C. of the corresponding racemate using a suitable chiral support or by fractional crystallisation of the diastereomeric salts formed by reaction of the corresponding racemate with a suitably optically active acid or base. In certain cases preferential crystallisation of one of the enantiomers can occur from a solution of a mixture of enantiomers, thus enriching the remaining solution in the other enantiomer.

20 For human use, the compounds of formula (I) or their salts can be administered alone, but will generally be administered in admixture with a pharmaceutically acceptable diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice. For example, they can be administered orally, including sublingually, in the form of
25 tablets containing such excipients as starch or lactose, or in capsules or ovules either alone or in admixture with excipients, or in the form of elixirs, solutions or suspensions containing flavouring or colouring agents. The compound or salt could be incorporated into capsules or tablets for targetting the colon or duodenum via delayed dissolution of said capsules or tablets for a particular time following oral administration. Dissolution could be controlled by susceptibility of
30 the formulation to bacteria found in the duodenum or colon, so that no substantial dissolution takes places before reaching the target area of the gastrointestinal tract. The compounds or salts can be injected parenterally, for example, intravenously, intramuscularly, intradermally or subcutaneously. For parenteral administration, they are best used in the form of a sterile aqueous solution or suspension which may contain other substances, for example, enough salt
35 or glucose to make the solution isotonic with blood. They can be administered topically, or transdermally, in the form of creams, gels, suspensions, lotions, ointments, dusting powders, sprays, foams, mousses, drug-incorporated dressings, solutions, sponges, fibres,

microemulsions, films, skin patches, ointments such as petrolatum or white soft paraffin based ointments or via a skin patch or other device. Penetration enhancers may be used, and the compound may be used in combination with cyclodextrins. In addition, the compound may be delivered using iontophoresis, electroporation, phonophoresis or sonophoresis. They could be administered directly onto a wound site. They could be incorporated into a coated suture. For example they can be incorporated into a lotion or cream consisting of an aqueous or oily emulsion of mineral oils; sorbitan monostearate; polysorbate 60; cetyl esters wax; cetearyl alcohol; 2-octyldodecanol; benzyl alcohol; water; polyethylene glycols and/or liquid paraffin, or they can be incorporated into a suitable ointment consisting of one or more of the following - mineral oil; liquid petrolatum; white petrolatum; propylene glycol; polyoxyethylene polyoxypropylene compound; emulsifying wax and water, or as hydrogel with cellulose or polyacrylate derivatives or other viscosity modifiers, or as a dry powder or liquid spray or aerosol with butane/propane, HFA, CFC, CO₂ or other suitable propellant, optionally also including a lubricant such as sorbitan trioleate, or as a drug-incorporated dressing either as a tulle dressing, with white soft paraffin or polyethylene glycols impregnated gauze dressings or with hydrogel, hydrocolloid, alginate or film dressings. The compound or salt could also be administered intraocularly for ophthalmic use e.g. via intraocular injection, or sustained release device or in a lens implant, via subconjunctival injection, or as an eye drop with appropriate buffers, viscosity modifiers (e.g. cellulose or polyacrylate derivatives), preservatives (e.g. benzalkonium chloride (BZK)) and agents to adjust tonicity (e.g. sodium chloride). Such formulation techniques are well-known in the art.

For certain uses, vaginal, rectal and nasal (e.g. by inhalation of a dry powder or aerosol) administration would be suitable.

25

All such formulations may also contain appropriate stabilisers and preservatives.

For oral and parenteral administration to human patients, the daily dosage level of the compounds of formula (I) or their salts will be from 0.001 to 20, preferably from 0.01 to 20, more preferably from 0.1 to 10, and most preferably from 0.5 to 5 mg/kg (in single or divided doses). Thus tablets or capsules of the compounds will contain from 0.1 to 500, preferably from 50 to 200, mg of active compound for administration singly or two or more at a time as appropriate.

Ocular Formulation

The compounds or their salts, solvates or prodrugs may be administered topically by the ocular route. They may be formulated as sterile, isotonic, pH adjusted, buffered suspensions or solutions. A polymer may be added such as crossed-linked polyacrylic acid, polyvinylalcohol,

hyaluronic acid, a cellulosic polymer (e.g. hydroxypropylmethylcellulose, hydroxyethylcellulose, methyl cellulose), or a heteropolysaccharide polymer (e.g. gelatin gum). Alternatively, they may be formulated in an ointment such as petrolatum or mineral oil, incorporated into bio-degradable (e.g. absorbable gel sponges, collagen) or non-biodegradable (e.g. silicone) implants, lenses or delivered via particulate or vesicular systems such as niosomes or liposomes. Formulations may be optionally combined with a preservative, such as benzalkonium chloride. In addition, they may be delivered using iontophoresis. The compound may also be used in combination with cyclodextrins.

- 10 An example of preferred formulation excipients of a compound, salt, solvate or prodrug according to the invention:

Ingredients	% (w/w) composition
NaH_2PO_4	0.370
15 Na_2HPO_4	0.567
Glycine	0.430
Carbomer 940	1.000
Water	to 100
pH adjusted to ~7	

20

The preferred formulation will be a buffered solution (preferably using monobasic and dibasic sodium phosphate) containing 0.5 to 5.0% of a cross-linked polyacrylic acid, pH adjusted to around 7 with the addition of a stabiliser such as glycine.

- 25 For topical administration to human patients with acute/surgical wounds or scars, the daily dosage level of the compounds, in suspension or other formulation, could be from 0.01 to 50mg/ml, preferably from 0.3 to 30 mg/ml.

30 The dosage will vary with the size of the wound, whether or not the wound is open or closed or partially closed, and whether or not the skin is intact.

The physician in any event will determine the actual dosage which will be most suitable for an individual patient and it will vary with the age, weight and response of the particular patient, as well as the efficacy of the drug compound. The above dosages are exemplary of the average case; there can of course be individual instances where higher or lower dosage ranges are merited, and such are within the scope of this invention.

Biological Test Methods

PCP Inhibition

- 5 In order to determine potency of PCP inhibitors a fluorogenic PCP cleavage assay was used. This assay is based on the template of Beekman et al. (FEBS Letters (1996), 390: 221-225) using a fluorogenic substrate. The substrate (Dabcyl-Arg-Tyr-Tyr-Arg-Ala-Asp-Asp-Ala-Asn-Val-Glu(EDANS)-NH₂) contains the cleavage site of human PCP (Hojima et al., J Biol Chem (1985), 260: 15996-16003). Human PCP has been purified from supernatant of stable transfected CHO
- 10 cells using hydrophobic interaction column followed by Superdex 200 gel filtration. 4 µg total protein of this enzyme preparation was incubated with various concentrations of the substance to be tested and 3x 10⁻⁶ M substrate in assay buffer (50 mM Tris-Base, pH 7.6 containing 150 mM NaCl, 5 mM CaCl₂, 1µM ZnCl₂ and 0.01 % Brij 35). The assay was performed in 96-well black fluorimeter plates and fluorescence was read continuously in a fluorimeter over 2.5 hours
- 15 ($\lambda_{\text{ex}} = 340 \text{ nm}$, $\lambda_{\text{em}} = 485 \text{ nm}$) at a constant 37°C with shaking. Release of the fluorogenic signal was in linear correlation to PCP activity. Reading of the mean velocity from 30 min after start of experiment until 2.5 hours was calculated by the Biolise software. IC₅₀ values were calculated by plotting % inhibition values against compound concentration using Tessela add in for Excel
- 20 spreadsheet. Example compounds were tested and were found to have IC₅₀ values vs. PCP of 1µM or less.

MMP Inhibition

- 25 The ability of compounds to inhibit the cleavage of fluorogenic peptides by MMPs 1, 2, 9, and 14 is described below.

The assays for MMPs 2, 9, and 14 are based upon the original protocol described by Knight et al. (Fed.Euro.Biochem.Soc., 296 (3), 263-266; 1992) with the slight modifications given below.

30 Inhibition of MMP-1

(i) Enzyme Preparation

- Catalytic domain MMP-1 was prepared at Pfizer Central Research. A stock solution of MMP-1 (1µM) was activated by the addition of aminophenylmercuric acetate (APMA), at a final
- 35 concentration of 1mM, for 20 minutes at 37°C. MMP-1 was then diluted in Tris-HCl assay buffer (50mM Tris, 200mM NaCl, 5mM CaCl₂, 20µM ZnSO₄, 0.05% Brij 35) pH 7.5 to a concentration of 10nM. The final concentration of enzyme used in the assay was 1nM.

(ii) Substrate

The fluorogenic substrate used in this assay was Dnp-Pro- γ -cyclohexyl-Ala-Gly-Cys(Me)-His-Ala-Lys(N-Me-Ala)-NH₂ as originally described by Bickett et al (Anal. Biochem, 212, 58-64, 1993).

5 The final substrate concentration used in the assay was 10 μ M.

(iii) Determination of Enzyme Inhibition

Test compounds were dissolved in dimethyl sulfoxide and diluted with assay buffer so that no more than 1% dimethyl sulfoxide was present. Test compound and enzyme were added to
10 each well of a 96 well plate and allowed to equilibrate for 15 minutes at 37°C in an orbital shaker prior to the addition of substrate. Plates were then incubated for 1 hour at 37°C prior to determination of fluorescence (substrate cleavage) using a fluorimeter (Fluostar; BMG LabTechnologies, Aylesbury, UK) at an excitation wavelength of 355nm and emission wavelength of 440nm. The potency of inhibitors was measured from the amount of substrate
15 cleavage obtained using a range of test compound concentrations, and, from the resulting dose-response curve, an IC₅₀ value (the concentration of inhibitor required to inhibit 50% of the enzyme activity) was calculated.

Inhibition of MMP-2 and MMP-9

20

(i) Enzyme Preparation

Catalytic domain MMP-2 and MMP-9 were prepared at Pfizer Central Research. A stock solution of MMP-2 / MMP-9 (1 M) was activated by the addition of aminophenylmercuric acetate (APMA). For MMP-2 and MMP-9, a final concentration of 1mM APMA was added, followed by
25 incubation for 1 hour at 37°C. The enzymes were then diluted in Tris-HCl assay buffer (100mM Tris, 100mM NaCl, 10mM CaCl₂ and 0.16% Brij 35, pH 7.5), to a concentration of 10nM. The final concentration of enzyme used in the assays was 1nM.

(ii) Substrate

The fluorogenic substrate used in this screen was Mca-Arg-Pro-Lys-Pro-Tyr-Ala-Nva-Trp-Met-Lys(Dnp)-NH₂ (Bachem Ltd, Essex, UK) as originally described by Nagase et al (J.Biol.Chem.,
30 269(33), 20952-20957, 1994). This substrate was selected because it has a balanced hydrolysis rate against MMPs 2 and 9 (k_{cat} / k_m of 54,000, 59,400 and 55,300 s⁻¹ M⁻¹ respectively). The final substrate concentration used in the assay was 5 μ M.

35 (iii) Determination of Enzyme Inhibition

Test compounds were dissolved in dimethyl sulphoxide and diluted with test buffer solution (as above) so that no more than 1% dimethyl sulphoxide was present. Test compound and enzyme were added to each well of a 96 well plate and allowed to equilibrate for 15 minutes at 37°C in an orbital shaker prior to the addition of substrate. Plates were then incubated for 1 hour at 37°C prior to determination of fluorescence using a fluorimeter (Fluostar; BMG LabTechnologies, Aylesbury, UK) at an excitation wavelength of 328nm and emission wavelength of 393nm. The potency of inhibitors was measured from the amount of substrate cleavage obtained using a range of test compound concentrations, and, from the resulting dose-response curve, an IC₅₀ value (the concentration of inhibitor required to inhibit 50% of the enzyme activity) was calculated.

Inhibition of MMP-14

(i) Enzyme Preparation

Catalytic domain MMP-14 was purchased from Prof. Tschesche, Department of Biochemistry, Faculty of Chemistry, University of Bielefeld, Germany. A 10 M enzyme stock solution was activated for 20 minutes at 25°C following the addition of 5 g/ml of trypsin (Sigma, Dorset, UK). The trypsin activity was then neutralised by the addition of 50 g/ml of soyabean trypsin inhibitor (Sigma, Dorset, UK), prior to dilution of this enzyme stock solution in Tris-HCl assay buffer (100mM Tris, 100mM NaCl, 10mM CaCl₂ and 0.16% Brij 35, pH 7.5) to a concentration of 10nM. The final concentration of enzyme used in the assay was 1nM.

(ii) Substrate

The fluorogenic substrate used in this screen was Mca-Pro-Leu-Gly-Leu-Dpa-Ala-Arg-NH₂ (Bachem Ltd, Essex, UK) as described by Will et al (J.Biol.Chem., 271(29), 17119-17123, 1996). The final substrate concentration used in the assay was 10µM.

Determination of enzyme inhibition by test compounds was performed in the same manner as described for MMPs-2 and -9 above.

All references mentioned herein in this text are incorporated by reference in their entirety.

The compounds of the invention are illustrated by the Examples below.

35 EXAMPLES AND PREPARATIONS

Melting points were determined using open glass capillary tubes and a Gallenkamp melting point apparatus and are uncorrected. Nuclear magnetic resonance (NMR) data were obtained using Varian Unity Inova-400, Varian Unity Inova-300 or Bruker AC300 spectrometers and are quoted in parts per million from tetramethylsilane. Mass spectral (MS) data were obtained on a Finnigan
5 Mat. TSQ 7000 or a Fisons Instruments Trio 1000. The calculated and observed ions quoted refer to the isotopic composition of lowest mass. Infra red (IR) spectra were measured using a Nicolet Magna 550 Fourier transform infra-red spectrometer. 6-Oxo-1,6-dihydropyridazine-3-carboxamide (J. Chem. Soc. 1948, 2195) (1.1 g, 8.0 mmol) was suspended in dichloromethane (20 mL), cooled to 0 °C then pyridine (1.3 mL, 16 mmol) and trifluoroacetic anhydride (1.2 mL, 8.4 mmol) were added and the reaction was stirred at room temperature for 1 hour. A further 5 mL of pyridine was added to aid solubility and then the reaction was warmed to room temperature and stirred overnight. The mixture was diluted with water (100 mL) and then extracted with dichloromethane (3 x 100 mL). The combined organic extracts were dried (Na₂SO₄), the solvent was removed *in vacuo*, with residual pyridine removed by azeotropeing with toluene. The residue was purified by flash chromatography on silica gel (dichloromethane /methanol 95:5 as eluant) to give the title compound as an off-white solid (0.8 g).

Preparation 41'

tert-Butyl (3*R*)-3-{3-[4-(aminocarbonyl)-2-pyridinyl]-1,2,4-oxadiazol-5-yl}-6-cyclohexylhexanoate

To a solution of the title compound from Preparation 40' (0.60 g, 1.3 mmol) in ethanol (3 mL) was added a saturated solution of ammonia in ethanol (15 mL) and the reaction was stirred at room temperature for 1.5 hours. Ammonia gas was bubbled through the reaction mixture for 30 minutes and then the reaction was stirred at room temperature for 48 hours. More ammonia gas was bubbled through the reaction mixture and the reaction was stirred at room temperature for 24 hours. The reaction mixture at this stage contained predominantly starting material. Concentrated aqueous ammonia solution (1 mL) was added, the reaction system was sealed and stirred at room temperature for 72 hours. The solvent was removed *in vacuo* and the residue was purified by flash chromatography on silica gel (graded elution with ethyl acetate/hexane 50:50 to 75:25) to give the title compound as a colourless oil (0.10 g).

Preparation 56'

N-(5-Cyano-2-pyridinyl)-2,2,2-trifluoroacetamide

To a solution of 6-aminonicotinonitrile (2.0 g, 15 mmol) and pyridine (4.7 mL, 58 mmol) in tetrahydrofuran (80 mL) at 0 °C was added trifluoroacetic anhydride (4.5 mL, 32 mmol) slowly, ensuring internal temperature did not exceed 5 °C. Once addition was complete the reaction was warmed to room temperature and stirred overnight. The solvent was removed *in vacuo*, the residue was then dissolved in ethyl acetate (100 mL) and washed with water (50 mL) then dried (MgSO₄). The solvent was removed *in vacuo* and the residue was purified by flash chromatography on silica gel (ethyl acetate/hexane 1:1 as eluant) to give the title compound as a white solid (2.7 g).

Preparation 59'

(3*R*)-3-[3-(6-Amino-3-pyridinyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoic acid

The title compound from Preparation 58' was dissolved in trifluoroacetic acid (5 mL) and the reaction was stirred at room temperature for 2 hours. The solution was evaporated to dryness and then the residue was azeotroped with toluene. The residue was dissolved in ethyl acetate (20 mL) and extracted with saturated sodium bicarbonate solution (20 mL). The organic layer was discarded and the aqueous layer was acidified to pH5 with 10% citric acid solution and then extracted with ethyl acetate (2 x 50mL). The combined organic extracts were washed with 10% citric acid solution (20 mL), water (20 mL) and then dried (MgSO₄). The solvent was removed *in vacuo* to give the title compound as a white solid (0.22 g).

Preparation 60'

20 2-(Dimethylamino)-N'-hydroxy-4-pyridinecarboximidamide

To a solution of hydroxylamine hydrochloride (0.47 g, 7.0 mmol) in methanol (10 mL) was added sodium metal (0.16 g, 7.0 mmol) portionwise. After all the sodium metal had dissolved 4-cyano-2-dimethylaminopyridine (1.0 g, 7.0 mmol) was added and the reaction was heated to reflux for 4 hours. The reaction was cooled to room temperature, filtered to remove precipitated sodium chloride and the filtrate was evaporated to dryness. The residue was dissolved in ethanol in order to crystallise the product but this was unsuccessful, so the solvent was removed *in vacuo* to give the title compound as a white solid (1.7 g), which was contaminated with ethanol.

To a solution of the title compound from Preparation 175 (1.0 g, 3.3 mmol) in dichloromethane (30 mL) was added 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (0.65 g, 3.3 mmol), 4-dimethylamino pyridine (0.04 g, 0.3 mmol), and the amidoxime from Preparation 60' (0.61 g, 3.3 mmol). Dimethylformamide (1 mL) was added to aid solubility and the reaction was stirred at room temperature overnight. The solution was washed with water (2 x 25 mL), saturated sodium bicarbonate solution (25 mL) and brine (30 mL). The organic layer was dried (MgSO₄), the solvent was removed *in vacuo* and the residue was heated at 120 °C for 2 hours. The residue was cooled to room temperature and then purified by flash chromatography on silica gel (dichloromethane/methanol/aqueous ammonia solution 98:2:0.2 as eluant) to give the title compound as a brown oil (0.50 g).

Trifluoromethanesulphonic anhydride (0.182 mL, 1.08 mmol) was added to a solution of triphenylphosphine oxide (0.603 g, 2.17 mmol) in dichloromethane (9 mL) at 0 °C under nitrogen. The reaction was stirred for 15 mins at 0 °C until a white precipitate was formed. A solution of the title compound from Preparation 162' (0.150 g, 0.36 mmol) in anhydrous dichloromethane (3 mL) was then added to the reaction, followed by triethylamine (0.2 mL, 1.44 mmol). After stirring for 10 mins the reaction was diluted with ethyl acetate (100 mL) and washed with 10% aqueous citric acid solution (50 mL), saturated aqueous sodium bicarbonate solution (50 mL) and brine. The organic layer was dried (Na₂SO₄), and concentrated in vacuo. The residue was then purified by flash chromatography on silica gel (hexane/diethyl ether 2:1 as eluant) to give the title compound as colourless oil (0.104 g).

A solution of 5-cyclohexylpentanoic acid (63.50g, 345mmol) in N,N-dimethylformamide (0.5ml) and dichloromethane (350ml) was cooled to 5°C and treated dropwise with oxalyl chloride

(31.6ml, 362mmol) over 30 minutes. The mixture was stirred at 0°C for 3 hours then the solvent was removed under reduced pressure to afford 5-cyclohexylpentanoyl chloride as a pale yellow solid (70.0g).

A solution of n-butyllithium (100ml, 250mmol, 2.5M in hexanes) was added via a cannula to a solution of (4S)-4-benzyl-1,3-oxazolidin-2-one (44.30g, 250mmol) in anhydrous tetrahydrofuran (400ml) at -78°C. The yellow solution was then stirred for 45 minutes. A solution of 5-cyclohexylpentanoyl chloride (55.5g, 275mmol) in tetrahydrofuran (100ml) was then added over 1 hour. The mixture was stirred at -78°C for 30 minutes then warmed to room temperature over 1 hour. The mixture was quenched with an aqueous solution of ammonium chloride (20% w/v, 400ml) and extracted with ethyl acetate. The layers were separated and the organic layer was washed with brine, dried over anhydrous sodium sulphate and the solvent removed under reduced pressure. The solid was recrystallised from hexane (500ml) to afford the title compound as a white solid (81.0g).

The reaction was stirred for 1 hour then quenched by dropwise addition of an aqueous solution of sodium thiosulphate (500ml) keeping the temperature below 20°C. The mixture was extracted with ethyl acetate (discarded) and the aqueous phase was acidified to pH 2 with solid citric acid and extracted with ethyl acetate. The combined organic phases were washed with brine, dried over anhydrous sodium sulphate and the solvent removed under reduced pressure. The residue was purified by column chromatography on silica gel eluting with a gradient system of hexane : ethyl acetate (2 : 1) gradually changing to hexane : ethyl acetate (1 : 1) to afford the title compound (40.7g)

Route C:

3-(Diethoxyphosphoryl)succinic acid 1-tert-butyl ester

Triethylphosphonoacetate (102g, 0.45 mol) was added dropwise over 11 min to a stirred solution of potassium *tert*-butoxide (60g, 0.54 mol) in THF (500ml), at 0°C, under nitrogen. The mixture was stirred for 1 hour at 0°C and then dichloromethane (300ml) was added and the reaction mixture was warmed to 25-30°C. The mixture was stirred at 25-30°C for 1 hour and then added dropwise over 33 minutes to a solution of *tert*-butyl bromoacetate (96g, 0.49 mol) in THF (500ml), at 0°C, under nitrogen. The mixture was stirred at 0-5°C for 2 hours and then a solution of citric acid (174g, 0.91 mol) in demineralised water (250ml) was added. The mixture was concentrated *in vacuo* to remove most of the THF and then toluene (750ml) was added. The organic phase was separated, washed with brine (2x150ml) and concentrated *in vacuo* to leave a colourless oil. The oil was taken up in ethanol and a solution of potassium hydroxide (36g, 0.64mol) in demineralised water (150ml) was added dropwise over 15 mins. The mixture was stirred at 0°C for 4 hours and then a solution of citric acid (158 g, 0.82 mol) in demineralised water (600ml), and toluene (600ml), were added. The organic phase was separated and the aqueous phase was re-extracted with toluene (600ml). The combined organic phases were washed with demineralised water (2x150ml) and concentrated *in vacuo* to leave a white solid. Toluene (150ml) was added and the slurry was re-concentrated *in vacuo* to leave a white solid. The product was purified by crystallisation from *tert*-butylmethyl ether (300ml) and cyclohexane (600ml) to give the title compound as a solid (79g).

Alternative preparation:

Triethylphosphonoacetate (12.0Kg, 53.5 mol) was added over 30 minutes to a stirred solution of potassium *tert*-butoxide (7.20Kg, 64.2 mol) in THF (118 litres), between 0 and 5°C, under nitrogen. The mixture was warmed to 25-30°C where it was stirred for 1 hour and then added over 45 minutes to a solution of *tert*-butyl bromoacetate (11.5Kg, 59.0 mol) in THF (28 litres), between 0 and 5°C, under nitrogen. The mixture was stirred at 0-5°C for 1 hour and then demineralised water (6.1 litres) and ethanol (30 litres) were added. A solution of potassium hydroxide (4.2Kg, 75.0 mol) in demineralised water (84 litres) was then added over 2 hours, between -5 and 0°C. The mixture was stirred at -10°C for 16 hours and then a solution of citric acid (16.5Kg, 85.8 mol) in demineralised water (32 litres) was added. The mixture was concentrated *in vacuo* to a volume of 180 litres and then ethyl acetate (90 litres) was added. The organic phase was separated and the aqueous phase was re-extracted with ethyl acetate (30 litres). The combined organic phases were washed with water (30 litres) and then stripped and replaced with cyclohexane by distillation at atmospheric pressure, at a constant volume of 72 litres. *tert*-Butylmethyl ether (18 litres) was added and the mixture was stirred at ambient

temperature for 12 hours and then filtered. The residue was washed with a mixture of cyclohexane (16 litres) and *tert*-butylmethyl ether (3.6 litres) then dried *in vacuo* for 16 hours to give the title compound as a colourless solid (10.0Kg, 60%).

(R)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-phenylpentanoic acid

A stirred solution of (E)-2-[2-(tert-butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid (100g, 0.34mol), cyclohexylamine (39ml, 0.34mol) and [(S)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl]chloro(p-cymene)ruthenium chloride (0.64g, 0.69mmol) in methanol (1000ml) was heated to 60°C, under hydrogen (60p.s.i.), for 42 hours and then allowed to cool to room temperature. The mixture was filtered through celite and then concentrated in vacuo to a yellow solid which was purified by re-crystallisation from acetone (850ml). The resulting solid was partitioned between ethyl acetate (1200ml) and citric acid solution (10%, 1200ml) and the organic phase was separated, washed with demineralised water (1200ml) and concentrated in vacuo to leave the title compound as an oil (80g).

¹H-NMR (CDCl₃) δ : 7.30-7.17 (5H, m), 2.85-2.78 (1H, m), 2.66-2.58 (3H, m), 2.37 (1H, br dd), 1.75-1.51 (4H, m), 1.40 (9H, s)

Preparation of cyclohexylamine salt:

A stirred solution of cyclohexylamine (266ml, 2.32 mol), (E)-2-[2-(tert-butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid (688g, 2.37 mol) and [(S)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl]chloro(p-cymene)ruthenium chloride (4.4g, 4.7 mmol) in methanol (6.9 litres) was heated to 60°C, under hydrogen (60p.s.i.), for 47 hours and then allowed to cool to room temperature (enantiomeric excess= 88%). The mixture was filtered through celite and then the solvent was stripped and replaced with acetone by distillation at atmospheric pressure, at a constant volume of 4.2 litres. The resulting suspension was cooled to room temperature where it was stirred for 4 hours and then filtered. The residue was washed with acetone (2x 1 litre) and

then dried *in vacuo* at 45°C for 16 hours to leave the title compound as a colourless solid (590g, 64%, enantiomeric excess=98.9%).

¹H-NMR (CD₃OD) δ : 7.23-7.09 (5H, m), 3.05-2.98 (1H, m), 2.64-2.56 (3H, m), 2.53 (1H, dd, *J* 15.2, 7.2Hz), 2.23 (1H, dd, *J* 15.2, 7.2Hz), 2.00-1.97, (2H, m), 1.85-1.81 (2H, m), 1.72-1.20 (10H, m), 1.40 (9H, s)

(R)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid cyclohexylamine salt

(R)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-phenylpentanoic acid cyclohexylamine salt (691g, 1.77 mol) and ethyl acetate (7.0 litres) were added to an aqueous solution of citric acid (10%, 6.3 litres) and the organic phase was separated, washed with water (7.0 litres) and concentrated *in vacuo* to a yellow oil. A solution of the oil and 5% rhodium on carbon (51.6g) in methanol (7.0 litres) was stirred at ambient temperature, under hydrogen (150p.s.i.) for 48 hours and then filtered through celite. To the filtrate was added cyclohexylamine (202ml, 1.77 mol) and the methanol solution was stripped and replaced with methylethyl ketone by distillation at atmospheric pressure, to a volume of 5.5 litres. The mixture was allowed to cool to ambient temperature where it was stirred for 48 hours and then filtered. The residue was washed with methylethyl ketone (2x 500ml) and then dried *in vacuo* at 45°C for 4 hours to leave the title compound as a colourless solid (495g, 71%).

(R)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid

A solution of (R)-2-[2-(tert-butoxy)-2-oxoethyl]-5-phenylpentanoic acid (2.2g, 7.5mmol) and 5%Rh/C (0.22g) in methanol (220ml) was stirred at room temperature, under hydrogen (150p.s.i.) for 24 hours and then filtered through celite. The filtrate was concentrated in vacuo to leave the title compound as an oil (2.0g).

¹H-NMR (CDCl₃) δ : 2.82-2.76 (1H, m), 2.60 (1H, br dd), 2.37 (1H, br dd), 1.70-1.60 (6H, m), 1.51-1.30 (3H, m), 1.42 (9H, s), 1.23-1.11 (6H, m), 0.96-0.80 (2H, m)

Preparation 176

tert-Butyl (3R)-3-[[[(Z)-1-amino-2-ethoxy-2-oxoethylidene]amino]oxy]carbonyl]-6-cyclohexylhexanoate

A solution of (2R)-2-[2-(tert-butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid (Preparation 175) (7.53g, 25.2mmol) in 1,4-dioxane (175ml) was treated with 1-hydroxybenzotriazole hydrate (3.75g, 27.8mmol) and the mixture cooled to 0°C. N,N'-Dicyclohexylcarbodiimide (5.47g, 26.5mmol) was then added and the mixture was stirred for 3 hours being allowed to warm to room temperature over this time. The mixture was then filtered and washed with 1,4-dioxane (2x50ml). The filtrate was then treated with sodium carbonate (4.01g, 37.8mmol) and ethyl 2-amino-2-(hydroxyimino)acetate (J.Org.Chem.;23; 1958; 1794) (3.33g, 25.2mmol). The resulting mixture was stirred at room temperature for 17 hours. The solvent was removed under reduced pressure and the residue was partitioned between ethyl acetate and water. The layers were separated and the aqueous phase was extracted with ethyl acetate (x2). The combined organic

layers were dried over anhydrous magnesium sulphate, filtered and the solvent removed under reduced pressure. The residue was purified by column chromatography on silica gel eluting with a gradient system of ethyl acetate : pentane (30 : 70) gradually changing to ethyl acetate : pentane (50 : 50) to afford the title compound as a white solid (6.50g).

CLAIMS

1. A compound of formula (I):

(I)

wherein:

X is C₁₋₆ alkylene or C₂₋₆ alkenylene, each of which is optionally substituted by one or more fluorine atoms;

R is aryl, C₅₋₈ cycloalkenyl or C₃₋₈ cycloalkyl optionally substituted by one or more fluorine atoms;

[HET] is a divalent heterocyclic moiety selected from

Z is H or C₁₋₄ alkyl,

Y is a mono- or bicyclic unsaturated ring system containing from 5 to 10 ring atoms, of which up to 4 which are hetero-atoms independently selected from N, O and S, and which ring system is optionally substituted by one or more substituents independently selected from =O, C₁₋₄ alkyl, C₁₋₄ alkoxy, NR¹R², SO₂NR¹R², CO₂R¹, CONR¹R², CH₂CO₂R¹, NR¹CO₂R², NR¹SO₂R² or het¹,

R¹ and R² are each independently selected from H and C₁₋₄ alkyl optionally substituted by C₁₋₄ alkoxy,

5 *het*¹ is a N-linked 4- to 6-membered mono- or bicyclic heterocycle optionally containing 1 or 2 further hetero ring atoms independently selected from N and O, which heterocycle is optionally substituted by one or more substituents independently selected from =O, C₁₋₄ alkyl, C₁₋₄ alkoxy, NR¹R², SO₂NR¹R², CO₂R¹, CONR¹R², CH₂CO₂R¹, NR¹CO₂R², NR¹SO₂R² or *het*²,

10 *het*² is a N-linked 4- to 6-membered mono- or bicyclic heterocycle optionally containing 1 or 2 further hetero ring atoms independently selected from N and O,

"aryl" is phenyl optionally substituted by one or more substituents independently selected from R³, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups,

15 and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.

2. A compound according to claim 1 which has the stereochemistry of formula (IA);

(IA)

20 and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.

3. A compound according to claim 1 or claim 2 wherein X is a linear C₂₋₆ alkylene moiety optionally substituted by one or more fluorine atoms, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.

25

4. A compound according to claim 3 wherein X is propylene, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof..

5. A compound according to any one of claims 1 to 4 wherein R is C₃₋₈ cycloalkyl optionally substituted by one or more fluorine atoms, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.

30

6. A compound according to claim 5 wherein R is cyclobutyl, cyclopentyl or cyclohexyl optionally substituted by one or more fluorine atoms, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.
- 5 7. A compound according to claim 6 wherein R is cyclohexyl, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.
8. A compound according to any one of claims 1 to 7 wherein Y is a 5- or 6-membered unsaturated ring containing 0, 1 or 2 ring hetero-atoms independently selected from N and O, and which ring is optionally substituted by one or more substituents independently selected from =O, C₁₋₄ alkyl, C₁₋₄ alkoxy, NR¹R², SO₂NR¹R², CO₂R¹, CONR¹R², CH₂CO₂R¹, NR¹CO₂R², NR¹SO₂R² and het¹, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.
- 10 9. A compound according to claim 8 wherein Y is a 5- or 6-membered unsaturated ring containing 0, 1 or 2 ring hetero-atoms independently selected from N and O, and which ring is optionally substituted by one or more substituents independently selected from =O, CONH₂, CONHCH₃, CON(CH₃)₂, CH₃, NH₂, CO₂C₂H₅, CO₂H, CH₂CO₂CH₃, NHCH₃, NHC₂H₅, N(CH₃)₂, morpholino, imidazol-1-yl, methoxy, ethoxy and NHSO₂CH₃, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.
- 15 10. A compound according to claim 9 wherein Y is 5-carbamoylpyridin-3-yl, uracil-5-yl, pyridin-4-yl, 6-methylpyridin-3-yl, 5-carboxypyridin-3-yl, 6-methoxycarbonylmethylpyridin-3-yl, 6-(4-methylpiperazino)pyridin-3-yl, 6-(3-dimethylaminoazetidino)pyridin-3-yl, 6-(3-morpholinoazetidino)pyridin-3-yl, 4-carboxypyridin-2-yl, 6-dimethylaminopyridin-3-yl, 6-(imidazol-1-yl)pyrazin-2-yl, 3-morpholinopyrazin-2-yl, 3-pyrrolidinopyrazin-2-yl, 3-dimethylaminopyrazin-2-yl, 3-methylaminopyrazin-2-yl, 3-methylsulphonamidophenyl, 3-carboxyphenyl or 6-ethoxypyrazin-2-yl, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.
- 25 11. A compound according to claim 10 wherein Y is uracil-5-yl or 4-carboxypyridin-2-yl, and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.
- 30 12. A compound according to any one of claims 1 to 11 wherein [HET] is 1,2,4-oxadiazol-3,5-ylene, and the salts, solvates and prodrugs thereof.
- 35

13. A compound of formula (I) according to claim 1 wherein each substituent is as specified in the Examples, and the salts, solvates and prodrugs thereof.
14. A compound according to claim 1 which is selected from any one of the Examples described
5 herein, and the salts, solvates and prodrugs thereof.
15. A compound, salt solvate or prodrug according to any one of claims 1 to 14 for use in medicine.
- 10 16. A compound, salt, solvate or prodrug according to any one of claims 1 to 14 for use in a medicament for the treatment of a PCP-mediated condition.
17. The use of a compound, salt, solvate or prodrug according to any one of claims 1 to 14 in the manufacture of a medicament useful for treating a PCP mediated condition and/or disease, such
15 as an antiscarring medicament.
18. A pharmaceutical composition comprising a compound, salt, solvate or prodrug according to any one of claims 1 to 14 and a pharmaceutically acceptable adjuvant, diluent or excipient.
- 20 19. A method of treating a PCP-mediated condition or disease, such as scar tissue, in a patient comprising administering to said patient a therapeutically effective amount of a compound, salt, solvate or prodrug according to any one of claims 1 to 14.
- 25 20. A process to make a compound according to claim 1, wherein the substituents are as defined herein, which comprises one or more of the following steps:

(II)

(III)

(IV)

(a) deprotecting a compound of formula (III) where P is a NHO-protecting group:

(b) reaction of a compound of formula (II) with hydroxylamine, optionally first reacting the acid (II) with a coupling agent;

5

(c) reaction of a an activated acid derivative (IV), where L is a suitable leaving group, with a protected hydroxylamine species "PONH₂", to give compounds of formula (III), above;

(d) reaction of a compound of formula (IV) with hydroxylamine;

10 and/or

(e) deprotection of a compound of formula (V) wherein P1 is a suitable carboxylic acid protecting group

15 to give a compound of formula (II) above.

21. A compound of formula (II), (III), (IV) or (V) according to claim 20.
